

PRESS RELEASE  
For Immediate Release

## **Launch of the Virtual Constructor®**

**A new online application that allows users to estimate construction projects and to obtain the exact list of materials and their quantities is now available in Canada.**

This web and mobile application enables consumers to estimate their own construction projects and get the unit quantities of required materials without any knowledge on the subject. The free application helps consumers plan the construction of their projects for patios, sheds and garages of any sort. Note that other types of projects will be available soon.

Users can review their projects with preliminary plans and 3D modeling while consulting the list of materials and the budgetary pricing which is adjusted in real time, according to every change. At any time, users can request unit quantities of materials for their project by e-mail. Thereby, they will receive a construction guide, various tips and advice from expert manufacturers in order to carry out the project.

In addition to this, several major manufacturers including Vicwest, Pylex, Taiga and more, provide their own content and information about their products such as benefits, installation guides, warranty programs and even videos aimed at qualified and knowledgeable customers.
